ABSTRACT

Disclosed is a document review apparatus which efficiently carries out document review by using a network. A document review apparatus comprises a memory unit which
5   stores a reviewed form comprising a written document, contents thereof to be reviewed by a plurality of reviewers. The document review apparatus receives a response, comprising information holding a review result of the reviewed form from another apparatus, and stores it in the
10   memory unit; when a predetermined number of responses have been stored, the document review apparatus creates statistical data relating to the contents of the responses, and displays the created statistical data in order to assist a user (the creator of the reviewed form) in revising the
15   reviewed form.
